

Lars Henning Pedersen is Clinical Professor at Aarhus University and Senior Consultant in fetal medicine at Aarhus University Hospital. He leads the multidisciplinary research group Personalised Medicine in Pregnancy, integrating pharmacogenomics, placental biology, reproductive epidemiology and data science to improve medication use during pregnancy. His research combines clinical cohorts and biological samples with Nordic registry data, with a strong focus on translation into clinical care. He is co-PI of GENIUS – Genotype First for Better Prenatal Care – which aims to develop early, cell-based non-invasive diagnostics for serious fetal genetic conditions and further investigates how maternal and fetal genetic variation may inform safer and more effective treatment for the mother and her unborn child.
